HEZID IMiS

Intelligent Multipurpose Identification System

HEZID IMiS offers an unique opportunity to recognize multiple identification factors including biometrics, random scenarios and services, all in a state of the art modular system.

Combinations of means of recognition and places where this recognition is done can be described in a strict chronological sequence in order to provide extremely high levels of security and protection.

The services module is applicable for places where different by type, time and cost services are provided. It is suitable for companies, enterprises, schools, banks, gyms, swimming pools, slides, spa centres, parking lots, hotels and more.

Each “Service” is described by the times and places where it can be used. **HEZID** monitors and charges the use of the services and provides reports for the use and access to each of them.

The users of the service use it automatically through their means of identification (RFID cards, PIN codes, key chains, biometric data, etc.). The system allows flexible pricing of the services provided.
